Contents

	Preface	page ix			
1	Introduction	1			
1.1	Data Analysis and Optimization	1			
1.2	Least Squares	4			
1.3	Matrix Factorization Problems	5			
1.4	Support Vector Machines	6			
1.5	Logistic Regression	9			
1.6	Deep Learning	11			
1.7	Emphasis	13			
2	Foundations of Smooth Optimization	15			
2.1	A Taxonomy of Solutions to Optimization Problems	15			
2.2	Taylor's Theorem	16			
2.3	Characterizing Minima of Smooth Functions	18			
2.4	Convex Sets and Functions	20			
2.5	Strongly Convex Functions	22			
3	Descent Methods	26			
3.1	Descent Directions	27			
3.2	Steepest-Descent Method	28			
	3.2.1 General Case	28			
	3.2.2 Convex Case	29			
	3.2.3 Strongly Convex Case	30			
	3.2.4 Comparison between Rates	32			
3.3	Descent Methods: Convergence 33				
3.4	Line-Search Methods: Choosing the Direction 36				
3.5	Line-Search Methods: Choosing the Steplength				

vi Contents

3.6	Convergence to Approximate Second-Order Necessary Points				
3.7	Mirror Descent				
3.8	The K	L and PL Properties	51		
4	Gradi	ient Methods Using Momentum	55		
4.1	Motiv	ation from Differential Equations	56		
4.2	Nesterov's Method: Convex Quadratics				
4.3	Convergence for Strongly Convex Functions				
4.4	Convergence for Weakly Convex Functions				
4.5	Conjugate Gradient Methods				
4.6	Lower Bounds on Convergence Rates				
5	Stoch	astic Gradient	75		
5.1	Exam	ples and Motivation	76		
	5.1.1	Noisy Gradients	76		
	5.1.2	Incremental Gradient Method	77		
	5.1.3	Classification and the Perceptron	77		
	5.1.4	Empirical Risk Minimization	78		
5.2	Randomness and Steplength: Insights				
	5.2.1	Example: Computing a Mean	80		
	5.2.2	The Randomized Kaczmarz Method	82		
5.3	Key Assumptions for Convergence Analysis				
	5.3.1	Case 1: Bounded Gradients: $L_g = 0$	86		
	5.3.2	Case 2: Randomized Kaczmarz: $B = 0, L_g > 0$	86		
	5.3.3	Case 3: Additive Gaussian Noise	86		
	5.3.4	Case 4: Incremental Gradient	87		
5.4	Convergence Analysis				
	5.4.1	Case 1: $L_g = 0$	89		
	5.4.2	Case 2: $B = 0$	90		
	5.4.3	Case 3: B and L_g Both Nonzero	92		
5.5	Implementation Aspects				
	5.5.1	Epochs	93		
	5.5.2	Minibatching	94		
	5.5.3	Acceleration Using Momentum	94		
6	Coord	linate Descent	100		
6.1	Coord	inate Descent in Machine Learning	101		
6.2	Coordinate Descent for Smooth Convex Functions				
	6.2.1	Lipschitz Constants	104		
	6.2.2	Randomized CD: Sampling with Replacement	105		
	6.2.3	Cyclic CD	110		

Contents vii

	6.2.4	Random Permutations CD: Sampling without		
		Replacement	112	
6.3	Block-	Coordinate Descent	113	
7	First-0	Order Methods for Constrained Optimization	118	
7.1	Optima	ality Conditions	118	
7.2	Euclidean Projection			
7.3	The Pr	ojected Gradient Algorithm	122	
	7.3.1	General Case: A Short-Step Approach	123	
	7.3.2	General Case: Backtracking	124	
	7.3.3	Smooth Strongly Convex Case	125	
	7.3.4	Momentum Variants	126	
	7.3.5	Alternative Search Directions	126	
7.4	The Co	onditional Gradient (Frank-Wolfe) Method	127	
8	Nonsn	nooth Functions and Subgradients	132	
8.1	Subgra	idients and Subdifferentials	134	
8.2	The Su	abdifferential and Directional Derivatives	137	
8.3	Calcul	us of Subdifferentials	141	
8.4	Conve	x Sets and Convex Constrained Optimization	144	
8.5	Optima	ality Conditions for Composite Nonsmooth Functions	146	
8.6	Proxin	nal Operators and the Moreau Envelope	148	
9	Nonsn	nooth Optimization Methods	153	
9.1	Subgra	ndient Descent	155	
9.2	The Subgradient Method			
	9.2.1	Steplengths	158	
9.3	Proxin	nal-Gradient Algorithms for Regularized Optimization	160	
	9.3.1	Convergence Rate for Convex f	162	
9.4	Proxin	nal Coordinate Descent for Structured Nonsmooth		
	Function	ons	164	
9.5	Proxin	nal Point Method	167	
10	Dualit	y and Algorithms	170	
10.1	Quadra	atic Penalty Function	170	
10.2	Lagran	ngians and Duality	172	
10.3	First-Order Optimality Conditions			
10.4	Strong	Duality	178	
10.5	Dual Algorithms			
		Dual Subgradient	179	
	10.5.2	Augmented Lagrangian Method	180	

viii Contents

10.5.3	Alternating Direction Method of Multipliers	181	
Some Applications of Dual Algorithms			
10.6.1	Consensus Optimization	182	
10.6.2	Utility Maximization	184	
10.6.3	Linear and Quadratic Programming	185	
Differe	entiation and Adjoints	188	
The Ch	nain Rule for a Nested Composition of Vector Functions	188	
The M	ethod of Adjoints	190	
Adjoin	ts in Deep Learning	191	
Automatic Differentiation			
Deriva	tions via the Lagrangian and Implicit Function Theorem	195	
11.5.1	A Constrained Optimization Formulation of the		
	Progressive Function	195	
11.5.2	A General Perspective on Unconstrained and		
	Constrained Formulations	197	
11.5.3	Extension: Control	197	
endix		200	
Definit	tions and Basic Concepts	200	
Conve	rgence Rates and Iteration Complexity	203	
Algori	thm 3.1 Is an Effective Line-Search Technique	204	
Linear	Programming Duality, Theorems of the Alternative	205	
		208	
Bound	s for Degenerate Quadratic Functions	213
